

KeynetikPOS

User Guide & Manual

For cashiers, supervisors and shop managers

Version 2.0.0

Keynetik Solutions • Next-GEN Professional Point of Sale System

Welcome

This manual explains how to use KeynetikPOS day to day — from logging in and ringing up a sale to managing stock, running reports and closing the till. No technical background is required. Looking for installation, backup or admin/server details? See the **System Documentation**.

Contents

- 1** Getting started
- 2** The main screen
- 3** Making a sale
- 4** Discounts
- 5** Taking payment & receipts
- 6** Working with multiple carts
- 7** Barcode scanning

- 9** Managing inventory
- 10** Shifts & cash drawer
- 11** Reports & analytics
- 12** Scheduled reports (WhatsApp / SMS)
- 13** User accounts & roles
- 14** Settings
- 15** Keyboard shortcuts
- 16** Frequently asked questions

1. Getting started

First login

When KeynetikPOS opens you'll see a login window. On a brand-new installation, use the default administrator account:

Field	Value
Username	admin
Password	admin123

You will be required to set a new password immediately on this first login — at least 8 characters and different from the old one. Keep it safe: there is no self-service reset for the last admin account.

Login attempts

You have 3 attempts per session. After three failures the app closes — just reopen it to try again.

Trial vs. full licence

In trial mode the app runs for 30 days and occasionally reminds you how many days remain. To unlock the full version, enter your CD key when prompted (or ask your administrator). KeynetikPOS works fully offline; internet is only needed to activate a key and to send scheduled reports.

Switching theme

KeynetikPOS supports Light and Dark themes. Toggle it any time from **Settings** → **Toggle Dark Mode**. Your choice is remembered.

2. The main screen

The main window is your sales workspace. Its main areas:

- **Menu bar** — File, Sales, Inventory, Reports, Settings, User, Help.
- **Product grid** (left) — cards for every product, colour-coded by stock (green = healthy, orange = low, red = critical, grey = out of stock). Each card shows the price and a stock note (e.g. “LOW — 3 left”, “OUT OF STOCK”).
- **Search box** — filter products by name or barcode as you type.
- **Category filter** — narrow the grid to one product category.
- **Cart panel** (right) — the current order: product, price, quantity (with – / ■ tap steppers), subtotal, and an ✕ to remove a line.
- **Totals panel** — subtotal, discount, tax, and the grand total.
- **Action buttons** — Apply Discount, Checkout, New Cart.
- **Status bar** (bottom) — who is logged in, their role, and transient messages (like “Change due: ...” after a sale).

The window adapts to your screen and works on touch displays (bigger tap targets, – / ■ quantity buttons). Drag the divider between the product grid and the cart to resize them.

3. Making a sale

- 1 **Add products to the cart**, by clicking a product card; or pressing **F3** to search by name/barcode and selecting the product (arrow keys + Enter add the highlighted card); or scanning a barcode (see §7).
- 2 **Adjust quantities** with the – and ■ buttons, or type a quantity. You can't exceed available stock — the app clamps it and warns you.
- 3 **Remove a line** with the **X** button on that row, or clear the whole cart with **Ctrl+W**.
- 4 Watch the **totals** update live (subtotal → discount → tax → total).
- 5 When ready, **Checkout** (press **F2** or click Checkout).

Out-of-stock items

Out-of-stock products appear greyed out and cannot be added.

4. Discounts

Discounts are protected to prevent accidental or unauthorised markdowns.

- 1 With items in the cart, click **Apply Discount** (or press **F4**).
- 2 Enter the **discount PIN** when prompted (set by your administrator in Settings).
- 3 Choose **Percentage** (e.g. 10%) or **Fixed amount** (e.g. KSh 50 off), enter the value, and type a **reason** (required — it's recorded for the audit log).
- 4 The dialog shows a **live preview** of the discount and the new total. A fixed discount can never push the total below zero, and a percentage can't exceed 100%.
- 5 Confirm. The discount applies to the current cart and is recorded against your user and shift.

Cashiers and Managers can apply discounts; Viewers cannot.

5. Taking payment & receipts

After Checkout (F2):

- 1 The **Payment** dialog opens. Choose a method: **Cash**, **Card**, **Mobile** (M-Pesa / mobile money), or **Multiple** (split tender).
- 2 Enter the **amount tendered**. For cash, **change due** is calculated live, and you can't confirm until the amount covers the total.
- 3 For **Mobile money**, enter the **reference number** (required) — it's printed on the receipt.
- 4 Confirm payment. The sale is recorded, stock is reduced automatically, and a **receipt** is generated.

Receipts

In the current build receipts are saved as PDF files (Receipt_<number>_<date>.pdf), so you can print, archive, or share them even without a printer. To reprint the last one: Sales → Reprint Last Receipt.

After a successful sale you'll see a brief confirmation and the change-due amount in the status bar — no pop-up to dismiss, so you can serve the next customer immediately.

6. Working with multiple carts

KeynetikPOS lets you keep several orders open at once — handy when a customer steps away to grab a forgotten item.

- **New cart:** File → New Sale, the New Cart button, or **F5**.
- **Switch carts:** click the cart tabs.
- **Delete or merge a cart:** right-click a cart tab for Delete Cart or Merge Cart.

Each cart has its own items, discount and totals. Checkout applies to the cart you're currently viewing.

7. Barcode scanning

KeynetikPOS works with two kinds of scanner, and usually needs no setup:

- **USB “keyboard-wedge” scanners** — plug in and scan; the product is added to the current cart automatically.
- **Serial / COM-port scanners** — selectable in settings (your administrator configures the COM port).

If you scan a code the system doesn't recognise, you'll see a quick “unknown barcode” message. You can assign a barcode to a product, or generate and print EAN-13 labels for unlabelled stock, from the barcode tools (under Inventory).

8. Refunds & sales history

Go to **Sales** → **View Sales History**.

- **Browse** every transaction with filters: date range, quick filters (Today, This Week), payment method, and free-text search.
- A **summary strip** shows total sales, count, average and tax for the current filter.
- **Drill down** into any sale to see its line items.
- **Export** the list to CSV.

To process a refund:

- 1 Select the **original sale** in the list.
- 2 Click **Refund** and enter a **reason**.
- 3 Confirm. The refund is recorded, stock is restored, and the sale is marked refunded.

Safeguards

You can't refund the same sale twice, and refunds always tie back to a real transaction. The Sales History window can stay open while you keep selling.

9. Managing inventory

Open **Inventory** → **Manage Inventory** for the full workbench, with tabs:

- **Overview** — searchable/filterable product table plus summary cards (total products, stock value, counts by status).
- **Stock Management** — edit stock directly in a spreadsheet-style grid; invalid entries are highlighted. Changes auto-save (or save explicitly), with undo/redo.
- **Alerts** — low- and critical-stock lists with one-click bulk restock.
- **Analytics** — stock value, fast and slow movers.

Other handy entry points:

- **Inventory** → **Add Product** — quickly add a new catalog item.
- **Inventory** → **Low Stock Alert** — a focused popup of exactly what needs reordering now, with restock buttons. A toast also pops up when an item crosses a low/critical threshold during sales.

Inventory features support CSV import/export and printing. Every manual stock change is logged (who, when, why). Adding/editing products and adjusting stock require Manager or Admin rights; deleting products is Admin-only. The Inventory window can stay open while you continue ringing up sales.

10. Shifts & cash drawer

Shifts track who was on the till and how much cash should be in the drawer.

- 1 **Open a shift** — enter the cashier name and the counted opening float (the cash you start with).
- 2 **During the shift**, sales, discounts and voids accumulate automatically.
- 3 **Close the shift** — the app shows the expected totals; count the drawer, enter the closing float and any notes.
The over/short variance is calculated for you.

Crash-safe

If the app crashes or the power cuts out mid-shift, the open shift is re-adopted on restart — you won't lose it.
End-of-shift figures feed the Z-Report (§11).

11. Reports & analytics

On-screen analytics

Reports → **Analytics Dashboard**: revenue today vs. yesterday (with change indicator), this week, this month and growth; top products, category breakdown, peak hours, and zero-sales alerts. Pick periods (7 / 30 / 90 days) or explicit date ranges, and view profit/margin and tax-collected metrics.

Quick daily report

Reports → **Daily Report** gives a fast snapshot of the day's numbers.

Operational reports

Choose a report type (sales by date, by category, by payment method, top sellers, daily summary) and a date range, then export to **CSV or PDF** — the printable documents for an accountant.

Z-Report (end of day / shift)

Gross sales, discounts, net sales, tax collected, transaction count, sales by category, top products, and cash reconciliation (opening float, closing float, expected cash, and the over/short variance) — the standard control document for detecting drawer shortages.

Reporting access depends on your role (Cashiers don't see reports; Viewers can view but not export).

12. Scheduled reports (WhatsApp / SMS)

KeynetikPOS can send reports to your phone automatically — so the owner gets the day's numbers without standing at the till. Set up under **Settings** → **Message Schedules**:

- 1 **Add a schedule** — name it, choose when it fires (Daily, Weekly, Monthly, on shift close, or when sales pass a threshold), pick which report (Z-Report, inventory alert, sales summary...), set the time, add recipients, and choose a provider (WhatsApp via Twilio, or SMS via Africa's Talking).
- 2 **Send Now** — test the schedule immediately to confirm your messaging credentials work (far better than discovering a typo at 9 p.m. when the nightly report silently fails).
- 3 **Enable / disable** schedules with the toggle; the list shows each schedule's status and when it last sent.

Provider credentials (Twilio SID/token/number; Africa's Talking key/username/sender ID) are entered by an administrator in Settings → Messaging.

13. User accounts & roles

Administrators manage staff accounts under **User** → **User Management**:

- Create, edit, enable/disable and delete users; change passwords. New users get a temporary password and must set their own at first login.
- A live password-strength indicator helps create strong passwords.
- A permissions viewer shows exactly what each role can do.

Anyone can change their own password via **User** → **Change Password**, and log out via **User** → **Logout** (or **Ctrl+L**). Logging out returns you to the login screen without closing the program.

What each role can do

Task	Admin	Mgr	Cashier	Viewer
Make sales	Yes	Yes	Yes	-
View sales	Yes	Yes	Yes	Yes
Apply discounts	Yes	Yes	Yes	-
Void / delete transactions	Yes	void	-	-
View inventory	Yes	Yes	Yes	Yes
Add/edit products, adjust stock	Yes	Yes	-	-
Delete products	Yes	-	-	-
View reports & analytics	Yes	Yes	-	Yes
Export reports	Yes	Yes	-	-
Manage users	Yes	-	-	-
Settings, backup, logs	Yes	-	-	-

Buttons and menu items you don't have permission for are greyed out.

14. Settings

Settings → **Company Information** (and related menus) open the configuration editor (Admin only), with tabs for:

Tab	What you set
Business	Name, address, phone, email, website, currency (default KSh), receipt footer.
Tax	Turn tax on/off, set the rate and label (e.g. "VAT"), choose tax-inclusive pricing if shelf prices already include tax.
Receipt	Header/footer and whether to print receipts.
Security	The discount PIN (entered twice) and whether a PIN is required for discounts.
Messaging	Twilio WhatsApp and Africa's Talking credentials, with a test-connection button.

Changes apply immediately — for example, changing the currency re-labels prices across the app without a restart.

15. Keyboard shortcuts

Fast keys for busy tills:

Key	Action
F1	Show keyboard shortcuts help
F2	Checkout (take payment)
F3	Focus the product search box
F4	Apply a discount
F5	New cart / new sale
Ctrl+N	New sale
Ctrl+W	Clear the current cart
Ctrl+L	Log out
Ctrl+Q	Exit the application

Hover over toolbar buttons to see their shortcuts in the tooltip.

16. Frequently asked questions

I forgot my password — what do I do?

Ask an administrator to reset it (User Management → Change Password). They'll set a temporary password that you'll change at your next login. If the last admin account is locked out, the system administrator must restore from a backup — see the System Documentation.

Do I need the internet to sell?

No. KeynetikPOS runs fully offline. Internet is only used to activate your licence and to send scheduled WhatsApp/SMS reports.

My barcode scanner isn't adding products.

Most USB scanners work with no setup. If yours connects by serial cable, ask your administrator to select the correct COM port. Check that the scanned product actually exists in the catalog — unknown codes show an “unknown barcode” message.

Why can't I see Reports / Settings / certain buttons?

Those require a higher role (Manager or Admin). Greyed-out items are ones your account isn't permitted to use.

Where do my receipts go?

They're saved as PDF files named Receipt_<number>_<date>.pdf. You can open and print them later, or attach a real printer for direct printing.

The total looks off by a cent on a big order.

Rounding on very large or unusual orders can occasionally differ by a cent due to how amounts are stored. For normal retail transactions this is not noticeable.

How do I back up my data?

That's an administrator task — the whole business is in one database file. See the Backup section of the System Documentation.
