- 17** Staff accounts, roles & permissions
- 18** Troubleshooting & FAQ

# 1. Welcome & what KeynetikPOS does

KeynetikPOS is a complete point-of-sale and small-business management system for shops and retailers. It rings up sales, tracks stock, manages customers and suppliers, records expenses, and keeps a full set of books — all on one Windows computer, with your data stored safely on the same machine.

## What you can do

- **Sell faster** — tap products or scan barcodes, take cash, card or M-Pesa, and print or email receipts.
- **Never run out** — live stock counts, low-stock alerts and per-product reorder levels.
- **Know your numbers** — daily takings, profit, top sellers and tax, on demand.
- **Keep customers** — phone-number lookup, loyalty points and store credit.
- **Stay compliant** — VAT-3 figures, PAYE/SHIF/NSSF payroll and a real double-entry ledger.

### Designed for Kenya

Prices are in Kenyan Shillings (KSh) by default, VAT follows the 16% standard rate, and M-Pesa is a first-class payment method with a reference number printed on every receipt. All of these are configurable in Settings.

# 2. Getting started

## Installing the app

- 1 Run the KeynetikPOS installer (KeynetikPOS-Setup.exe) and follow the prompts.
- 2 A desktop and Start-menu shortcut are created. Double-click to launch.
- 3 On first launch the app creates its database automatically in your private app-data folder — no setup required.

## Activating your licence

KeynetikPOS asks for a CD key the first time it runs. Enter the key you were given. Activation happens online; if the internet is down, the app activates locally so an offline shop is never locked out. A trial period is available before activation.

## Signing in

Log in with your username and password. The system ships with one administrator account so you can get started:

| Field    | Default value |
|----------|---------------|
| Username | admin         |
| Password | admin123      |

### Change the default password immediately

On first login as admin you are required to set a new password (minimum 8 characters). Passwords are stored securely (PBKDF2 hashing) — never in plain text.

# 3. The sales screen at a glance

The main window is split into two panels. The **left** shows your products; the **right** is the current sale (the cart).

| Area             | What it is                                                |
|------------------|-----------------------------------------------------------|
| Search box       | Type a product name or scan a barcode to find items fast. |
| Category buttons | Filter the product grid to one category.                  |

| Area                   | What it is                                                                                    |
|------------------------|-----------------------------------------------------------------------------------------------|
| <b>Product grid</b>    | Tap a card to add the item to the cart. Cards are colour-coded by stock level.                |
| <b>Cart table</b>      | The items in the current sale, with quantity steppers (minus / plus) and a remove (X) button. |
| <b>Cart tabs</b>       | Run several sales at once — start a new tab for a second customer and switch between them.    |
| <b>Totals</b>          | Live subtotal, tax and total as you add items.                                                |
| <b>Checkout button</b> | Opens payment to finish the sale.                                                             |

### Touchscreen-friendly

Buttons, cards and the minus/plus quantity steppers are sized for finger taps, so KeynetikPOS works on a touchscreen terminal as well as with a mouse and keyboard.

## 4. Making a sale, step by step

- 1 Add items.** Tap a product card, scan its barcode, or search by name. Repeat for every item.
- 2 Adjust quantities.** Use the minus / plus steppers in the cart, or type a quantity. Stock is checked so you can't oversell.
- 3 Apply a discount** (optional) — see section 6.
- 4 Attach a customer** (optional) to earn loyalty points or use store credit — see section 7.
- 5 Press Checkout** and take payment — see section 5.
- 6 Hand over the receipt.** Print it, or email it to the customer.

After a sale the cart clears and the cursor returns to the search box, ready for the next customer. The change due is shown on the status bar so a queue keeps moving.

### Multiple carts

Need to pause one customer to serve another? Open a new cart tab. Each tab is an independent sale; switch back any time to finish it.

## 5. Taking payment

Pressing Checkout opens the payment dialog. Choose a method, enter the amount tendered, and the change is calculated for you.

| Method                       | Notes                                                                                                                                         |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Cash</b>                  | Enter the amount received; change due is shown.                                                                                               |
| <b>Card</b>                  | Record a card payment with an optional reference.                                                                                             |
| <b>M-Pesa (Mobile Money)</b> | A reference number is required and is printed on the receipt for reconciliation.                                                              |
| <b>Split payment</b>         | Combine methods on one sale — e.g. part cash, part M-Pesa. Each tender is recorded separately so your end-of-day method totals stay accurate. |

### Receipts

- **Print** to a connected thermal or standard printer.
- **Email** the last receipt to the customer (requires email settings — see section 15).
- Receipts show the cashier, items, tax, totals, payment method and any M-Pesa reference.

## 6. Discounts

Discounts are protected by a PIN so only authorised staff can apply them. You can give either a **percentage** (e.g. 10% off) or a **fixed amount** (e.g. KSh 50 off).

- 1 In the cart, open the discount dialog.
- 2 Enter the discount PIN.
- 3 Choose percentage or fixed amount and enter the value, with an optional reason.
- 4 The discount is applied to the total and recorded for the audit trail.

#### Set your discount PIN

The discount PIN is configured under Settings. Every discount is logged with the staff member, amount and reason, so nothing is given away untracked.

## 7. Customers, loyalty & store credit

Attaching a customer to a sale lets them earn rewards and pay with store credit.

| Feature               | How it works                                                                           |
|-----------------------|----------------------------------------------------------------------------------------|
| <b>Quick lookup</b>   | Find a customer by phone number at checkout.                                           |
| <b>Loyalty points</b> | Earned automatically — 1 point per KSh 100 spent. Redeem points for store credit.      |
| <b>Store credit</b>   | A balance the customer can spend on future sales. Top it up manually or let it accrue. |
| <b>History</b>        | Each customer's past purchases are available from the Customers screen.                |

Open the **Customers** screen to add a customer, edit details, adjust store credit, or redeem loyalty points.

## 8. Refunds

A refund reverses a past sale: it restocks the items and records the refund for your books. Refunds require the relevant permission and a reason.

- 1 Open the Refund screen (or select a sale in Sales History and choose Process Refund).
- 2 Enter or confirm the sale number; its items are shown.
- 3 Type the reason for the refund.
- 4 Confirm. Stock is returned and the refund is logged.

#### No double refunds

A sale can only be refunded once. The system blocks a second refund automatically so stock is never credited back twice.

## 9. Inventory & stock control

The **Inventory** screen is mission control for stock: view and edit products, see stock levels at a glance, and manage reorder thresholds.

- **Add / edit products** — name, category, cost price, profit margin (the selling price is computed for you), stock quantity, reorder level and barcode.
- **Low-stock alerts** — products at or below their reorder level are flagged; the product grid colours cards red/orange/green by status.
- **Reorder levels** — set per product so alerts match how fast each item sells.
- **Stock take** — count physical stock and post adjustments; every change is logged with a reason and who made it.
- **Backup Now** and other admin actions live on the menus.

**Every stock change is auditable**

Sales, refunds, deliveries and manual adjustments each write an audit row recording the old and new quantity, the reason, the user and the time.

## 10. Purchasing: suppliers & purchase orders

Track stock *arriving* into the business, with costs, so your margins stay accurate.

- 1 Open **Suppliers** and add the businesses you buy from.
- 2 Open **Purchase Orders** and create a new order: choose a supplier and add the products and quantities you're ordering, each with its unit cost.
- 3 When the goods arrive, mark the order **Received**.
- 4 Receiving raises stock for every line, updates each product's cost price to the latest, and logs an adjustment — all in one step.

**Costs flow through automatically**

Receiving a purchase order updates the product cost used for profit calculations, so your reports reflect what you actually paid.

## 11. Expenses

Record business expenses (rent, utilities, wages, other) so your profit-and-loss is complete. Open the **Expenses** screen, choose a category, enter the amount and date, and save. Expenses are deducted from gross profit in the P&L report and posted to the ledger.

## 12. Reports, analytics & sales history

| Report                     | Tells you                                                                                                                                |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Daily report</b>        | Today's takings and transaction count at a glance.                                                                                       |
| <b>Detailed reports</b>    | Sales by date range, category or payment method; top sellers; daily summary; profit & loss; stock valuation — exportable to CSV and PDF. |
| <b>Analytics dashboard</b> | Date-range metrics: sales, profit, margin, tax, discounts, items, top products and slow movers.                                          |
| <b>Sales history</b>       | Browse and search every past sale; view details or start a refund.                                                                       |

Use the date pickers and quick filters (Today, Last 7 days, This month, etc.) to focus any report on the period you care about.

## 13. Shifts & the Z-report

Shift tools let a cashier open a till with a counted starting float and close it with a settlement (Z-report) showing expected versus counted cash. Use these to reconcile the drawer at the end of a shift.

Note: shift opening/closing is available as a tool; ask your administrator if it has been enabled for your terminal.

## 14. Finance: ledger, payroll & VAT

KeynetikPOS includes a real accounting back office (Finance menu, available on the full ERP tier). Sales, purchases and expenses post to it automatically.

| Module                | What it gives you                                                                                             |
|-----------------------|---------------------------------------------------------------------------------------------------------------|
| <b>General Ledger</b> | A double-entry trial balance that always reconciles; post manual journal entries.                             |
| <b>Payroll</b>        | Kenyan statutory payroll — PAYE, SHIF, NSSF and Housing Levy — with payslips and a posted wage journal.       |
| <b>VAT</b>            | VAT-3 return figures (output and input VAT) over any period, with per-product tax codes; record VAT payments. |

### One tax rate, everywhere

The VAT rate and the POS sale-tax rate are the same single setting, so what customers are charged always matches what your VAT return reports.

## 15. Settings

- **Business** — shop name, contact details, currency symbol and code.
- **Tax** — enable/disable tax, the rate, and whether prices are tax-inclusive.
- **Discount PIN** — the code required to apply discounts.
- **Email (SMTP)** — server, port, security and credentials for emailing receipts; the password is encrypted at rest.
- **Messaging** — WhatsApp / SMS providers for scheduled messages and reports.
- **Theme** — switch between light and dark at any time.

## 16. Backups & data safety

Your data lives in a single database file on this computer. KeynetikPOS protects it for you:

- **Automatic daily backup** — once per day the app copies the database to a backups folder and keeps the newest ten copies.
- **Backup Now** — make an on-demand backup from the menu before risky operations.
- **Integrity checks** — backups are verified so you know they're readable.

### Keep a copy off the machine

The built-in backups guard against accidental data loss, but they're on the same computer. Periodically copy the backups folder to a USB drive or cloud storage to survive hardware failure.

## 17. Staff accounts, roles & permissions

Administrators manage staff under **User Management**. Each user has a role that controls what they can see and do.

| Role                 | Typical access                                                          |
|----------------------|-------------------------------------------------------------------------|
| <b>Administrator</b> | Everything — settings, users, reports, refunds, backups.                |
| <b>Manager</b>       | Day-to-day operations and reports; most actions except sensitive admin. |
| <b>Cashier</b>       | Selling, basic lookups; restricted from sensitive actions.              |

Permissions gate individual actions (refunds, discounts, stock adjustments, reports, backups). Buttons a user isn't allowed to use are disabled, and the rule is also enforced underneath the UI.

## 18. Troubleshooting & FAQ

| Question / problem                                | What to do                                                                                                           |
|---------------------------------------------------|----------------------------------------------------------------------------------------------------------------------|
| <b>I forgot the admin password</b>                | Another administrator can reset it under User Management. If none exists, contact your supplier.                     |
| <b>The app says my licence is invalid</b>         | Check the key was entered correctly. If you changed computers, you may need a re-activation — contact your supplier. |
| <b>A barcode scanner isn't adding items</b>       | Confirm the scanner is connected; the search box must have focus. Scanners type the code then press Enter.           |
| <b>Receipt email didn't send</b>                  | Check the SMTP settings and that the computer is online. Use an app password if your mail provider requires one.     |
| <b>Stock looks wrong</b>                          | Open the product's stock history to see every change; run a stock take to correct and log the difference.            |
| <b>A sale won't complete (insufficient stock)</b> | Another action reduced stock; re-check quantities. The sale is kept so you can adjust and retry.                     |

KeynetikPOS User Manual • Version 2.0 • Keep this guide near the till for quick reference.
